Multi-Factor Model

Analyzes multiple risk variables, including macroeconomic indicators, currency, commodity, and industry-specific factors, to provide a comprehensive risk assessment. This model helps us understand the potential impact of various factors on portfolio performance.

Correlated Pair Trading

Track a large universe of thematically related stocks, commodities and ETFs, identifying opportunities to benefit from tectonic changes while limiting current sector risk by shorting companies being left behind.

Dynamic Protection Strategies

Dynamic Option Collars

Dynamic option collar system dampen high volatility holdings to make them more palatable to institutional investment while controlling hedging costs and tax effects.

Stop-loss Discipline

Dynamic window trailing stop-loss mechanisms, backed by external research and internal validation ensure timely exit from losing positions while allowing for short term fluctuations··· separating signal from noise.
